1) Subject and Type

Meter type CDM100*****

Instead of the *** letters and numerals will be inserted which characterize the following modifications:

2) Description

The CDM100 flow sensor is used in combination with the CDM Density transmitter for Density measurement, forming a Liquid Density Meter.

The flow sensor, which consists of magnetically excited oscillating tubes, contains as electrical components coils, resistors, temperature sensors and terminals and connectors.

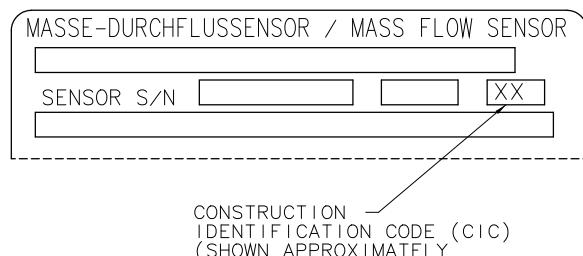

The CDM Density transmitter has its own certificate IECEx BVS 13.0009 X.

When used with an integral CDM Density transmitter, the variation gets the denomination type CDM100*****.

Modifications to the design which have impact on the electrical parameters are indicated by a Construction Identification Code (CIC). This code consists out of two digits, starting with an A and followed by a sequence number; for example A4. The CIC can be found on the approval label, see picture below:

3.1.4. Temperature class/ maximum surface temperature T.

The classification into a temperature class/determination of the maximum surface temperature T depends on the temperature of the medium taking into account the maximum operating temperature of the sensor and is shown in the following graphs:

3.1.4.1.

Meter type
